According to the magazine: "But at their core, computers and graphic design are very different beasts. CAD is a powerful but rigidly structured system, designed to work with a fairly standardized set of parameters. Since computers were (and largely still are) capable of more flexible calculations, the manual approach to design represented a major leap forward." File formats Archive formats for CAD AutoCAD DWG is a native format for the architectural, engineering, and construction industries. It is based on the Autodesk DWG/DWF standard and shares the same XML tags and attribute set. The latest version of AutoCAD DWG (2010) supports PDF vector and raster art embedded with the drawing content. PDF art can be viewed in the "Figure" view and all layer properties are visible. AutoCAD DWF is an ASCII format based on DGN-based technology and it is compatible with the native DWG and DXF formats. A lot of tools, software packages, and hardware solutions are available to create, edit, and convert DWF files. The DWF file format was introduced in 2002. AutoCAD LT is a vector-based product that replaces the use of AutoCAD's native Raster Graphics Language (RGL) files. AutoCAD LT retains the base-level functionality of AutoCAD in terms of drawing features. AutoCAD X3D is a format for the 3D visualization of models that is designed to be used with AutoCAD as well as some other CAD applications. The format is used to capture the three-dimensional geometry of AutoCAD models into XML files. It consists of two files, the Model file, which holds the geometry of the model, and the Scene file, which is the scene graph that describes the model geometry. AutoCAD Map is the map format of Autodesk. It was introduced in 1998. AutoCAD Map 3D is the 3D version of the Autocad Map format. It was introduced in 2001. I have the following code: (function() { 'use strict'; var apiKey ='my api key goes here', server = ""; $('#wap p').click(function() { location.href = server + '?token=' + apiKey + '&page=' + $(this).attr('id'); }); }()); But it is not working, and I think the problem is due to the way it is declared. Is there a way to do this, so that it is working? A: If you wish to make the click handler global, wrap it in a self executing function to allow that (function() { 'use strict'; var apiKey ='my api key goes here', server = ""; $('#wap p').click(function() { location.href = server + '?token=' + apiKey + '&page=' + $(this).attr('id'); }); }()); , f.Name)) default: // E.g., map[K]V if tf.Elem().Kind() == reflect.Ptr { // Proto struct (e.g., *T) dfi.discard = func(src pointer) { sm := src.asPointerTo(tf).Elem() if sm
